

"THE BANDIT" CONTINUED:

After these checks the antenna was checked on another radio by a friend, with the same results, but he discovered that he could tune from 26.000 to 28.000 and not exceed 1.5:1 over the whole range! I found the coax could be cut to any length without effecting SWR. How about that?! You get a 10 day money back guarantee and 12 months on damage or workmanship. In other words, if you damage the antenna yourself, it is still guaranteed same as K40. But the only thing I didn't like about the antenna and K40 still has them beat, is the magnetic mount. It is too small. It would not stay on my 4-wheeler over rough country.

The antenna removal is good and the coax connector is super. Just screw it off. K40 is quicker and excellent. The other mounting methods are good also. You can mount the antenna on a stick or pole and it will match and work good. Results approach a Big Stick. When I tried K40 I had to cut approximately 14" off and match was still high.

Looks like Lamtech has a real winner. Hang in there and Good Luck.

- ANOTHER EXCITING NEW PRODUCT RELEASE - EXPO 100 KIT

This small, compact unit is the answer for the people who have a Cobra AM radio such as the 29GTL or 87GTL or 21XLR. It also fits the new President AM's and many other manufacturers' AM radios.

Installation is simple. All you do is remove a capacitor and install the coax in its place, then hook up the power.

A complete line of EXPO kits are available for your particular radio from your favorite dealer or supplier.
