

!NEW PRODUCT RELEASE!

COMING SOON!!

CARD-KIT DOES IT AGAIN:

Card-Kit Electronics has just announced that they will be releasing a new kit ("B" Kit) for marketing, approximately 1 July 1983. The kit will add low channels (26.955-26.510) and/or low half channels (26.950-26.510). This kit will fit practically all of the newer, single crystal, AM units. Specifically, those units employing the LC7130, LC7131, TC9106P, uPD2814C, and uPD2816C PLL Chips that also use a 10.7 Ceramic or Crystal filter in their receiver section.

Also there will be a modification made on the "A" Kit (covered in Volume 14) that will enable you to choose to obtain either full channels or half channels above channel 40.

Since this type of unit appeared in the market 4 years ago many theories have been discussed and almost as many experiments have been tried. Some of these experiments have been marketed but they like in full 40 channel coverage and will not track on frequency.

It turns out we all tried to make it more difficult than it was. Borrowing from the old practice of switching the TX and RX crystals on the old direct crystal units to allow the Civil Air Protrol to use a pair of channel 10 crystals to obtain their frequency (26.620) was the bases for this mod. This means all that was needed was to reverse the direction of shift of the PLL Chip. In order to receive the desired frequency all that was needed was to switch the filter that passed 10.695 and blocked the anti-image to a filter that passed the anti-image and blocked the 10.695. Simple huh? It is just as simple to use.

The installation of this kit into approximately 50 different units will be featured in SECRET CB Volume 17. DON'T MISS IT....
